

Experiment 6

Demonstrate virtualization by Installing Type-2 Hypervisor in your device, create and configure VM image with a Host Operating system (Either Windows/Linux) using virtual box

Aim

To demonstrate virtualization by installing a **Type-2 hypervisor (Oracle VM VirtualBox)** and creating and configuring a **Linux-based virtual machine** with the required CPU, RAM, and storage.

Procedure

1. Install **Oracle VM VirtualBox** on the host operating system.
2. Open **VirtualBox Manager** and click **New**.
3. Enter the VM name as **Ubuntu VM** and select **Linux/Ubuntu (64-bit)**.
4. Allocate the required **CPU, RAM and storage** as given in the experiment.
5. Create a **virtual hard disk** and set its size as required.
6. Attach the **Ubuntu ISO file** to the virtual optical drive.
7. Click **Start** to boot the virtual machine.
8. Install Ubuntu inside the virtual machine.
9. After installation, restart the VM and verify that Ubuntu runs successfully.
10. Thus, a virtual machine is created using the Type-2 hypervisor.

Output:

Result

The **Type-2 hypervisor Oracle VM VirtualBox** was successfully installed, and an **Ubuntu virtual machine** was created, configured and executed successfully.
